Lauren Prete

SOFTWARE ENGINEERING MANAGER

Selden, New York • laurenprete.com • LinkedIn

Software engineering leader with **nearly a decade** across the full stack, front-end to embedded. A systems engineer and integrator at heart: connects complex systems, leads the teams that build them, and stays hands-on in the code. Currently architecting a production automation platform that drives factory bring-up, the migration of a 30-plus-app monolith to cloud microservices, and a Rust-based hardware SDK, across three engineering groups.

TECHNICAL SKILLS

LANGUAGES & FRAMEWORKS	C# · Java · Rust · C · Groovy · .NET Framework/Core/6+
FRONTEND	JavaScript · TypeScript · Angular · React · Tailwind
DATABASES	SQL Server · PostgreSQL · MySQL
DEVOPS, AI & CLOUD	Docker · Jenkins · GitLab CI · AWS (EC2, ECS, RDS, Lambda, S3, etc) · IaC (Ansible, Terraform) · LLM integration (OpenAI, Anthropic)

EXPERIENCE

North Atlantic Industries, Inc.

Bohemia, NY

2026 — Software Engineering Manager PRESENT July 2026 – Present

- Own software engineering across three pillars: business software, greenfield embedded, and production automation.
- Lead a ~10-person engineering organization, developing leads and delegating team and project ownership.
- Own performance management, including reviews, promotion cases, and addressing underperformance early.
- Set technical direction while remaining hands-on in architecture and critical-path implementation.
- Retain direct ownership of the production automation platform, the organization's most critical and fastest-changing system, as its architect and first line of response for production-floor issues.

2024 — Software Engineering Lead June 2024 – July 2026

- Led and mentored a team of 6 full-stack engineers and 1-3 interns annually.
- Owned engineering hiring for full-time and intern roles: designed the interview loop, matching technical panels to each role's skills, and created and piloted a take-home program of three candidate-selected exercises.
- Architected and led the migration of a 30+ app monolithic on-prem API to cloud-native .NET microservices on AWS, spanning customer service, inventory, ERP/finance, etc.
- Architected and owned the company's production automation platform for automated bring-up of embedded products on the floor: pipeline orchestration, firmware and config programming, test-equipment control, and per-unit traceability.
- Built the platform's execution layer as a custom Jenkins plugin (Java) that abstracted the distributed, concurrent hardware logic behind a clean Groovy DSL.
- Spearheaded a modular Rust SDK giving customers a clean, modern API to our embedded hardware.
- Led the team that standardized software delivery on a single build-once, promote-to-prod GitLab CI model, now the default across most projects.

2020 — Senior Software Engineer June 2020 – June 2024

- Primary or major author of over a dozen internal applications, services, and tools across engineering, finance, and operations.
- Designed and built frontends focused on usability and performance in Angular, React, and Tailwind.
- Wrote substantial business logic in the SQL Server data layer (stored procedures, functions, triggers, views) and built operational and financial reports for business teams.
- Redesigned and rebuilt the company's RMA system, replacing a monolithic WebForms/jQuery app with a decoupled Angular client and .NET API and leading its rollout across operations, quality, and customer service.

2019 — Software Engineer June 2019 – June 2020

- Created the company's key financial-indicator reports in SQL and a standalone .NET application to deliver them to the CFO and finance team.
- Built a jQuery frontend/.NET API backend that made a SQL-based production-batching system accessible to the factory floor, ultimately becoming the team's main tool for visualizing and managing work orders.
- Ramped quickly onto core internal API and contributed features/fixes across a range of internal applications.

Software Solutions Consulting, Inc.

Ronkonkoma, NY

Web Application Developer Sept 2018 – June 2019

- Delivered custom full-stack web applications and APIs for a range of clients, using C#, .NET (MVC/Web Forms), and JavaScript.
- Developed data models, SQL stored procedures, triggers, and functions to drive critical business logic and data processing.
- Managed client relationships and full project lifecycles, turning business requirements into delivered solutions and providing critical production support across the portfolio.

Garment Printer Ink

East Northport, NY

Full Stack Web Developer July 2017 – Sept 2018

- Designed and built full-stack enhancements for a LAMP-based e-commerce platform, improving the user experience and contributing to increased sales.
- Executed a platform migration from Magento 1 to Magento 2 with 100% data integrity and minimal downtime.
- Built custom Magento 2 modules, including customer review systems and CMS workflows to streamline backend management.

EDUCATION

B.S. in Computer Science

May 2017

Stony Brook University · Stony Brook, NY
